

Senkung des erhöhten Venendruckes

114. DOG-Kongress, 30. September 2016

Dr. Michael Bärtschi

PhD (Biomedicine), M. medical Education, M.Sc.Optom., FAAO

I declare not having any financial interest in marketing or selling any of the products described in this presentation.

Between June 2011 and 2015, Prof. Josef Flammer and myself were owner of the exploitation right of Patent WO 96/32884 and US Patent 6,027,454
“Ophthalmometry” originally proposed by Dr. Loew, Germany.

Research Grant: LHW Foundation, Triesen/Lichtenstein

Klinische Behandlungsanwendungen bei erhöhtem retinalem Venendruck (RVP):

- **Nifedipin Retard 5mg (Adalat, Bayer)***
- **Magnesium 10 – 20 mmol (300 - 500mg)***
- **Macitentan 10mg (Opsumit, Actelion)****

** Bei POAG und primär vaskulärer Dysregulation (Flammer-Syndrom) : Auszug aus
“Nahrungsmittel zur Unterstützung der Glaukomtherapie bei Patienten mit vaskulärer
Dysregulation”, Universitätsspital Basel*

*** Pilotstudie bei Hypoxie bedingtem erhöhtem RVP (Diavolezzastudie 2014)*

Erhöhter retinaler Venendruck ist publiziert bei:

- Glaucoma (*Pillunat et al. 2014; Fang et al. 2014; Morgan et al. 2009; Jonas, Harder 2003*)
- Vein occlusion (*Mozaffarie et al. 2014; Yasuda et al. 2010; Jonas et al. 2007*)
- Flammer Syndrome (*Fang et al. 2014*)
- Diabetes (*Cybulska et al. 2015*)
- Hypoxia - high altitude induced (*Baertschi et al. 2016*)

and potentially in temporary Amaurosis (*Baertschi, ISMM 2014*)

- retinal Hemorrhages and Optic Nerve Head Edema
(*multiple 1975-2009*)

Die Folgen des verringerten okulären Perfusionsdruckes als Resultat des erhöhten retinalen Venendruckes:

- “Ungenügende okuläre Perfusion der Netzhaut verursacht eine Mangeldurchblutung und führt zu einem Sauerstoffmangel im Gewebe, welches wiederum schädliche, das Sehen bedrohende Effekte auslöst.”

Arjamaa, O. and M. Nikinmaa, Oxygen-dependent diseases in the retina: role of hypoxia-inducible factors. Exp Eye Res, 2006. 83(3): p. 473-83.

Risk Factors for Incident Open-angle Glaucoma

The Barbados Eye Studies 2008

M. Cristina Leske, MD, MPH,^{1,2} Suh-Yuh Wu, MA,^{1,2} Anselm Hennis, FRCP(UK), PhD,^{1,3,4}
Robert Honkanen, MD,² Barbara Nemesure, PhD,^{1,2} BESs Study Group

Leske et al • Risk Factors for Incident Open-angle Glaucoma: The Barbados Eye Studies

Figure 1. Risk factors for definite open-angle glaucoma (OAG; n = 3222). hx = history; PP = perfusion pressure; RR = risk ratio; SBP = systolic blood pressure. *Based on Cox regression models, adjusting for age, gender, intraocular pressure (IOP), and IOP- and blood pressure-lowering treatment; central corneal thickness (CCT) is presented as an odds ratio, based on logistic regression model in a subsample (n = 1023).

“Perfusionsdruck ist definiert als die Differenz zwischen arteriellem und venösem Blutdruck und ist die treibende Kraft des Blutflusses.”

Schmidl, D., G. Garhofer, and L. Schmetterer, The complex interaction between ocular perfusion pressure and ocular blood flow - relevance for glaucoma. Exp Eye Res, 2011. 93(2): p. 141-55.

Ophthalmodynamometry by Dr. Bernhard Loew, Germany

Tissue	Function and characteristics	Involved cell or fiber layer
Retina	Autoregulation e.g. Flicker, IOP/ICP, Endothelin-1 Low flow rate Low perfusion rate Low venous oxygen saturation High vascular resistance High oxygen extraction	Inner limiting membrane Optic nerve fibers Ganglion layer
Choroidea	No Autoregulation Very high flow rate High perfusion rate Very high venous oxygen saturation Low vascular resistance Low oxygen extraction

THERAPY FOR FLAMMER SYNDROME

Flammer syndrome is mostly harmless, and therefore, most subjects require no treatment. However, if the symptoms are annoying or affected individuals develop related diseases, we consider treatment as necessary. The intensity of the treatment depends on the clinical picture and the individual situation. Although treatment has been conducted on treatment, we can still assist these patients based on lifestyle management.

Lifestyle management
Most subjects...

**Empfehlung: Magnesium 10-20mmol / Tag
Nifedipine 5 mg / Tag**

... recommend eating enough to avoid... blood pressure is low, salt and fluid intake can be... to avoid excessive nocturnal blood pressure dips. Omega-3 fatty acids, as... are also recommended. Since oxidative stress, induced by the unstable oxygen supply, may increase, particularly in the eye, antioxidative diet is considered.

Drug treatment
Magnesium, a physiological calcium channel blocker (CCB), reduces the vasoconstrictive effect of endothelin-1 and improves BF regulation. A relatively high dose of at least 10–20 mmol/day magnesium is needed. The only side effect observed is diarrhea, which mitigates quickly when the dose is reduced. If not sufficient, then magnesium is combined with a very low dose (!) of calcium channel blockers. But it must be done only with a doctor's prescription. Many other substances are currently under investigation. Ginkgo biloba (figure below) has already been proved effective.

The effect of nifedipine on retinal venous pressure of glaucoma patients with the Flammer-Syndrome

L. Fang, S. Turttschi, Maneli Mozaffarieh 

Results: **The RVP decreased significantly** after 3 weeks in both eyes of patients **treated with low-dosed Nifedipine** compared to the untreated group (mean **decrease of 12.5 mmHg** (SD 12.5), $P < 0.001$). A **larger response** to therapy was found in patients with FS compared to patients lacking the FS (mean decrease of 12.5 mmHg vs. 12.3 mmHg, $P < 0.001$). **Differences were accounted for in the IOP's** of the patient after treatment. In the untreated control group, no significant differences were accounted for either in the RVP or the IOP after 3 weeks.

Empfehlung: Nifedipine 5mg / Tag

Conclusions: **Treatment with low-dosed Nifedipine decreases RVP in both eyes of glaucoma patients, particularly in those with the Flammer-Syndrome.** This effect may be due to the partial inhibition of **Endothelin-1 (ET-1)** by Nifedipine.

- **Increased plasma Endothelin- 1 level** is a common denominator of several ocular diseases such as **glaucoma** ⁽¹⁾, **diabetic retinopathy** ⁽²⁾ or **retinal vein occlusion** ⁽³⁾ and systemic syndromes such as **Flammer Syndrome** ⁽⁴⁾ or **systemic Hypoxia** ⁽⁵⁾.
- ET-1 acts as strong vasoconstrictor on vascular smooth vessels.

Retinal vessel regulation at high altitudes¹

Article type: Research Article

Authors: Neumann, Thomas^{a,*} | Baertschi, Michael^{b,c} | Vilser, Walthard^d | Drinda, Stefan^e | Franz, Marcus^f | Brückmann, Andreas^g | Wolf, Gunter^a | Jung, Christian^h

[Clinical Hemorheology and Microcirculation, vol. 63, no. 3, pp. 281-292, 2016](#)

CONCLUSIONS: Retinal arterial and venous vessels react to Normobaric Hypoxia and Hypobaric Hypoxia with a diameter increase and an impaired response to flicker light. **Macitentan was capable to normalize the increased retinal venous pressure observed at high altitudes.**

- ⊙ Der retinale Venendruck lässt sich medikamentös klinisch signifikant senken. ^(1, 2)
- ⊙ Es bestehen mit Nifedipin und Magnesium jahrelang klinisch erprobte Tx Ansätze. (Universität Basel, Prof. Flammer)
- ⊙ Evidenz für ET-1 Blocker als zukünftige Therapie ist gegeben. ⁽²⁾
 - *Weitere klinische Multizenterstudien sind notwendig bezüglich optimierter Dosierung bei unterschiedlichen Krankheitsbildern.*
 - *Weitere pharmakologische Entwicklungen sind notwendig zur Erweiterung der Therapiebrette.*
